Abstract of the Disclosure

A machine for filling and sealing two-part capsules includes a capsule delivery device, which has a plurality of receptacles, each for one capsule at least one capsule, expulsion station having a capsule expulsion device for axially expelling the capsules from the respective receptacle; guide flaps which are individually controllable by an actuating device and are pivotable relative to a pivot shaft and are each assigned to one capsule receptacle and which each have two guideways, triggerable by means of the actuating device, for the respective associated capsules; and partitions, which separate the guideways of adjacent guide flaps from one another. The partitions are each an integrated component of one guide flap.
